Optical Diagnostics Group,
DTU Chemical Engineering, Frederiksborgvej 399, Roskilde, DK-4000, Denmark

Keywords: high-resolution spectroscopy, gas cells, databases

High-resolution spectroscopy of gases is a powerful technique which has various fundamental and practical applications: *in situ* simultaneous measurements of gas temperature and gas composition, radiative transfer modeling, validation of existing and developing of new databases and etc. Existing databases (e.g. HITRAN, HITEMP or CDSD) can normally be used for absorption spectra calculations at limited temperature/pressure ranges. Therefore experimental measurements of absorption/transmission spectra gases (e.g. CO₂, H₂O or SO₂) at high-resolution and elevated temperatures are essential both for analysis of complex experimental data and further development of the databases.

High-temperature gas cell facilities available at DTU Chemical Engineering are presented and described. The gas cells and high-resolution spectrometers allow us to perform high-quality reference measurements of gases relevant to, for example, atmospheric research, combustion and gasification. Some high-temperature, high-resolution IR/UV absorption/transmission measurements gases (e.g. CO₂, SO₂, SO₃ and phenol) are presented.
